

**BUSINESS CARD SHEET CONSTRUCTION AND METHODS OF MAKING AND  
USING SAME**

**Abstract of the Disclosure**

Ultraremovable adhesive is applied to a paper sheet to form therewith a liner sheet and  
5 the liner sheet is laminated to a cardstock sheet to form a laminate cardstock. The cardstock  
sheet is then die cut therethrough, but not through the liner sheet, to form cardstock cut lines that  
define at least in part perimeters of business cards (or other printable media). The outer face of  
the liner sheet is then die cut therethrough, but not through the cardstock sheet, to form liner  
sheet strips on a back side of the cardstock sheet. Some of the strips define cover strips covering  
10 some of the cardstock cut lines, and others of the strips define waste strips. The waste strips are  
then matrix removed from the back of the cardstock sheet. The resulting business card sheet  
construction is then fed through a printer or copier by the user and the desired indicia printed on  
the front sides of the business cards, while the cover strips hold the cards together as a unit sheet  
construction. After this printing operation, the printed cards are easily peeled off of the cover  
15 strips, ready for use. By designing the sheet construction to form the printed media with  
different sizes and shapes and by including optional scored fold lines, and/or additional  
flexibility cut lines or flexibility perforation lines, media aside from business cards, such as post  
cards and greeting cards, can be constructed and used pursuant to this invention.
